Income and Longevity: A Global Analysis of Income per Capita and Life Expectancy in 2020

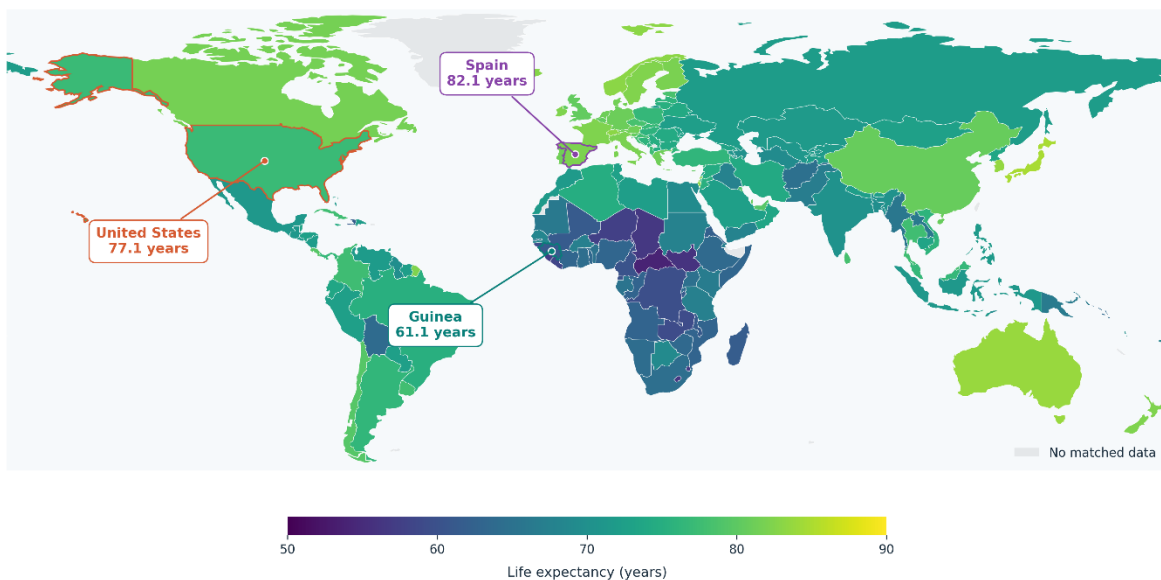

This report explores the relationship between life expectancy and income per capita across 3 different countries in 2020. We see that countries with higher incomes tend to have (**not always**) a better health outcome.

For instance, Spain has a higher life expectancy despite having a lower income than the US; And a simple reason behind this could be explained by how the resources are allocated/invested in domain like healthcare.

On the other hand, we see that Guinea illustrates the broader picture of how income prosperity could be a strong determinant of health and life expectancy.

Life expectancy at birth | 2020

Expected lifespan of a newborn under the mortality rates observed in 2020 • Years

Source: supplied lex.csv; 2020 only. 194 observations; 166 matched to map polygons.

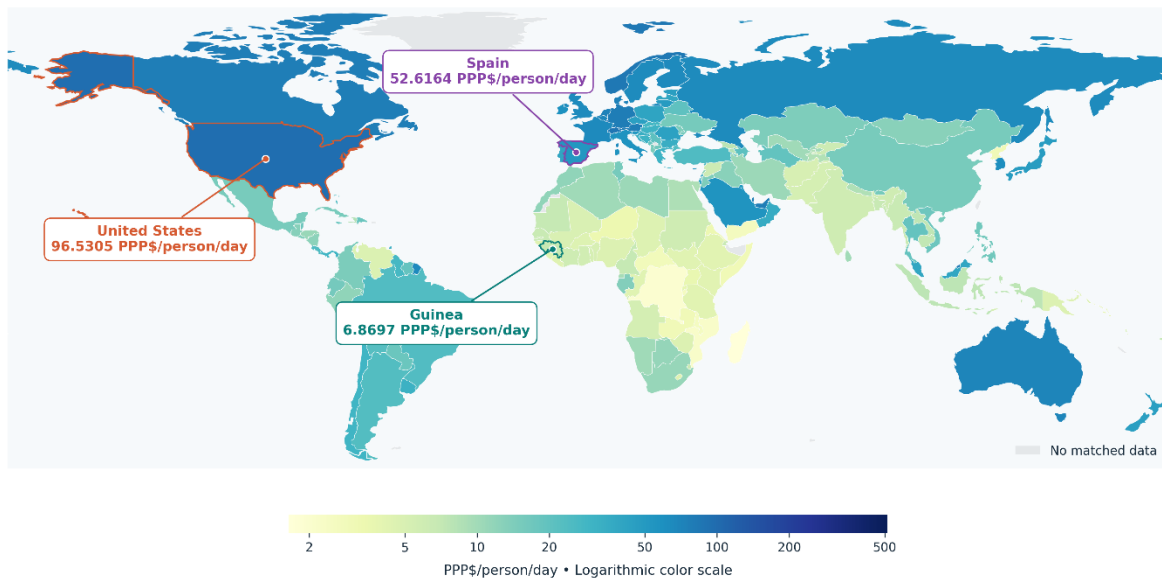

Boundaries: Natural Earth 1:110m. Small countries may not appear at this resolution. Plate carrée projection; Antarctica omitted.

- **United States:** Life expectancy of **77.1 years** and income per capita of **96.5 PPP-adjusted units**.

- **Spain:** Life expectancy of **82.1 years** and income per capita of **52.6 PPP-adjusted units**.
- **Guinea:** Life expectancy of **61.1 years** and income per capita of **6.9 PPP-adjusted units**.

Average daily income | 2020

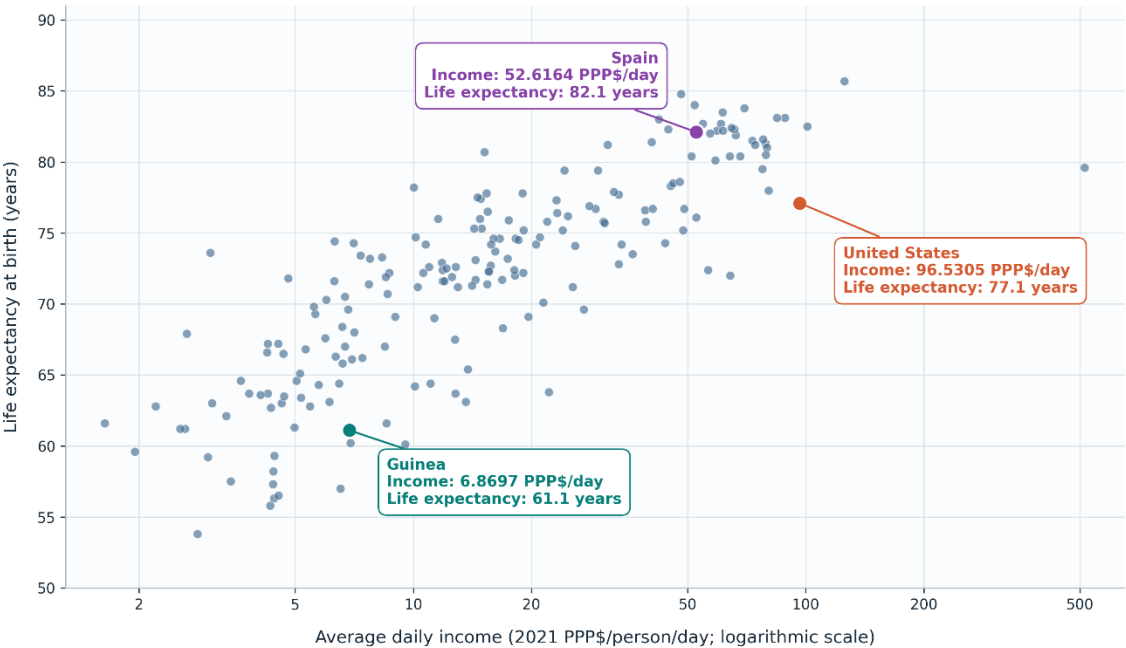

Mean household income or consumption per person • Constant international dollars (2021 PPP)

Countries with lower income per capita, like Guinea, have a lower life expectancy due to lack of basic health infrastructure. Investment in healthcare in these countries should be a priority to reduce this health disparity.

Daily income and life expectancy | 2020

Each dot represents one country • 193 countries with both indicators

Source: supplied lex.csv and mincpap_cppp.csv; joined by country code for 2020. Countries have equal point weights.
Income measures mean household income or consumption per person. Association does not establish causation.
